Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence comprises the amino acid sequence encoded by exons and 4 of the human DAN/Cerberus-related protein 6 (hDCR6) cooling sequence. The coding sequence was isolated from a human kidnay cDNA library containing exons 1 and 4 of the sequence. HDCR6 is closely related to the DAN and DCR5 proteins, both of which act as antagonists morphogenic proteins such as BMP. It is possible that the hDCR6 gene an protein can be used as immunogens, modulators of cell function, growth and differentiation, to reduce undesirable bone formation, to identify DCR6 binding agents, in diagnosis, and in gene therapy.

This shows the human transforming growth factor-beta (TGF-beta) thinding protein designated hBEER. The cDNA and protein may be used for CC prevention, treatment and diagnosis of diseases associated with CC inappropriate BEER expression. For example, they may be used to treat CC disorders associated with decreased TGF-beta BP expression. The cDNA or CC vectors may be administered to treat diseases by rectifying mutations or CC eletions in a patient's genome that affect the activity of BEER by CC expressing inactive proteins or to supplement the patients own production CC faEER polypeptides. The nucleic acids may be used for recombinant CC production of BEER, gene therapy, antisense therapy as probes for CC diagnostic assays and for functional studies. BEER may be used to raise CC antibodies and for identification of BEER modulators. BEER antagonists CC may be used to increase bone mineral content for the treatment of CC disorders such as osteopenia, osteoporosis, fractures and other CC disorders associated with low mineral content.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids (I) encoding a transforming growth factor beta binding protein, useful for identifying agents for treating osteopenia, osteoporosis and fractures

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches 2301;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            comprises a substitution of isoleucine for the wild-type valine at residue 10. The cDNA and protein may be used for prevention, treatment and diagnosis of diseases associated with inappropriate BEER expression. For example, they may be used to treat disorders associated with decreased TGF-beta BP expression. The cDNA or vectors may be administered to treat diseases by rectifying mutations or deletions in a patient's genome that affect the activity of BEER by expressing inactive proteins or to supplement the patients own production of BEER polypeptides. The nucleic acids may be used for recombinant production of BEER, gene therapy, antisense therapy, as probes for diagnostic assays and for functional studies. BEER modulators. BEER antagonists may be used to raise antibodies and for increase bone mineral content for the treatment of disorders such as osteopenia, osteoporosis, fractures and other disorders associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; Page 118-119; 162pp; English.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
This cDNA encodes a human transforming growth factor-beta (TGF-beta) to the chromosome 17q1-21. The cDNA and protein may be used for chromosome 17q1-21. The cDNA and protein may be used for contents associated with treat clisorders associated with descreased TGF-beta BP expression. For example, they may be used to treat clisorders associated with decreased TGF-beta BP expression. The cDNA or vectors may be administered to treat diseases by rectifying mutations or deletions in a patient's genome that affect the activity of BEER by expressing inactive proteins or to supplement the patients own production of BEER polypeptides. The nucleic acids may be used for recombinant CC production of BEER, gene therapy, antisense therapy, as probes for CC diagnostic assays and for functional studies. BEER may be used to raise antibodies and for identification of BEER modulators. BEER antagonists can be used to increase bone mineral content for the treatment of CC disorders such as osteopenia, osteoporosis, fractures and other CC disorders such as osteopenia, osteoporosis, fractures and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

For example, they may be used to treat disorders associated with decreased TGF-beta BP expression. The cDNA or vectors may be administered to treat diseases by rectifying mutations or deletions in a patient's genome that affect the activity of BEER by expressing inactive proteins or to supplement the patients own production of BEER polypeptides. The nucleic acids may be used for recombinant production of BEER, gene therapy, antisense therapy, as probes for diagnostic assays and for functional studies. BEER may be used to raise antibodies and for identification of BEER modulators. BEER antagonists may be used to increase bone interal content for the treatment of discreters.

The cDNA and protein may be used for prevention, treatment and diagnosis of diseases associated with inappropriate BEER expression. For example, they may be used to treat disorders associated with decreased TGP-beta BP expression. The cDNA or vectors may be administered to treat diseases by rectifying mutations or deletions in a patient's genome that affect the activity of BEER by expressing inactive proteins or to supplement the patients own production of BEER polypeptides. The nucleic acids may be used for recombinant production of BEER, gene therapy, antisense therapy, as probes for diagnostic assays and for functional studies. BEER may be used to raise antisodies and for
                                                                                                                                                                                                                                                                                                                                                                              identification of BEER modulators. BEER antagonists may be used to increase bone mineral content for the treatment of disorders such exterior osteopenia, osteoporosis, fractures and other disorders associated
